

# Change management – batch 3

Discontinuation of servlets, viewing and manual download from the client portal

The clients portal is gradually making way for two new environments which our clients are already making considerable use of.

## 1. Access to “open” data

\*Servlets are programmes which are used to build applications which generate dynamic webpages (HTML, XML). They are web links integrated into applications for retrieving data. This technology is now obsolete, having been superseded by APIs.

## 2. The data will be switched in batch 3

- Generation forecasts and installed power of capacities under a Compulsory Purchase Contract (CPC) with EDF
- Cross Border Balancing
- Balance of exchange programs
- NTC daily forecast import/export
- NEBEF mechanism Demand Response
- Certified capacities registry

### 3. Correspondence between old and new offering

#### Old Client Portal Offering

#### New Services and Data Portal Offering
